ABSTRACT

Sri Lanka is an island surrounded by Indian Ocean. She enriched with various types of natural forests. Sri Lankan climatic condition determines on these forests variation. When concerning bio diversity we have a wide range of bio diversity due to variations on rainfall, soil, and geographical location. Forests are very valuable and play a vital role in environment. At present deforestation results, many environmental issues and its impacts drastically influence on environmental security. When recalling natural disasters occurred in past few years, we lost many human lives and properties. When analysing root cause in depth it has direct or indirect influence on deforestation. Homeland Security is a concept, which has introduced by United States of America, once they realised the real threats of terrorism and natural hazards. After that, they implemented this concept with broader aspect, gain advantages, and ensure their national security. In this research study, helps to identify types and extent of environmental issues resulting from deforestation. Further, examine how these environmental issues influence on homeland security. In order to explore on degrade these environmental issues through the implementing effective strategies for policy makers, other relative authorities and address the consequence of Homeland Security. This research study recommends that government and policy makers to pay attention on necessity of implementing Homeland Security concept in Sri Lanka. Further this research concern on mitigate of forthcoming any security relates issues with specific reference to environment security aspects.
